

CARROT

Take first fully expanded leaf – usually the fourth or fifth leaf out from the growing point. Take the whole leaf including the whole length of the petiole (leaf stalk), which starts on the top of the root.

Sample at least **80 petioles**, randomly across the sampling area to obtain a representative sample. If the petioles are small, more petioles will need to be collected. The part to be tested is the petiole (leaf stalk).

If you require a Sap 4 comprehensive analysis please collect **two times** as many petioles.

Monitoring program

Begin sampling at 5 – 6 leaf stage. Sample fortnightly or every three weeks to “bulking up” stage.

Additional Notes:

- To ensure that the laboratory is able to perform the entire test suite required and that the optimal levels supplied on the laboratory report are relevant, please ensure that the above instructions are followed.

**1ST FULLY EXPANDED LEAF
FROM GROWING POINT**

- Place samples into a plastic sample bag, not in paper, as paper will dry out the sample and may not allow for enough sap to be extracted for the analysis requested.

CARROT

DIFFERENTIAL SAP ANALYSIS

New Vs Old Leaf testing is not available for this crop.
