

TIMBER TREES

Take leaves that are about $\frac{3}{4}$ expanded on the latest flush.

Sample at least **160 leaves** through the plantation, no more than 6 per tree. Sample at about shoulder height if possible, (or from limbs that have been recently removed) at up to three different points around the tree.

No Sap 4 comprehensive analysis is available for this crop.

Monitoring program

Usual sampling times are:

- as required during main growing period of the year
- main sampling period is during the first 2-4 years of tree establishment

1ST FULLY EXPANDED LEAF

TIMBER TREES

DIFFERENTIAL SAP ANALYSIS

Take leaves that are about $\frac{3}{4}$ expanded on the latest flush. These will become your NEW LEAF SAMPLE.

Take old leaves that are fully expanded from the same growing stem. These will become your OLD LEAF SAMPLE.

Monitoring program

Usual sampling times are:

- as required during main growing period of the year
- main sampling period is during the first 2-4 years of tree establishment
